

DIAGNOSING FD¹

- Certain cardiac and systemic red flags increase the likelihood of a Fabry disease diagnosis; the closer the finding is located to the centre of the circle, the more likely the diagnosis could be Fabry disease

eGFR = estimated glomerular filtration rate; GLS = global longitudinal strain; HFpEF = heart failure with preserved ejection fraction; LVH = left ventricular hypertrophy; lyso-Gb3 = globotriaosylsphingosine; NT-proBNP = NT-pro-brain natriuretic peptide; RVH = right ventricular hypertrophy.
